

Caleffi Combined PRV and cold fill Monobloc manifold assembly

Size: Various sizes and pressures available

Function:

Pressure reducing valves (PRV) are installed in domestic water systems to reduce and stabilise the inlet pressure from the mains supply, which is generally too high and variable for domestic appliances to function properly.

Description:

The unit comprises of a manifold containing a pressure reducing valve, a cold water balancing port with check valve, a check valve and a preset pressure relief valve

The unit can be installed either horizontally or vertically with the PRV always first in line.
