

## Surrey Flange

**Size:** 15mm to suit cylinder outlet of 1" BSP female.

Suited to pumps up to 1.5 bar pressure

**Function:**

Considered an industry standard, the surrey flange has dominated the market place for over years.

Designed to provide an independent hot water supply, dramatically reducing air surging, noise and temperature variations. Connections are made directly into the hot water supply tank. With a built in air vent, the surrey flange automatically purges the shower circuit, preventing air accumulation in the hot water feed. After trapping the air, the vent releases it from the hot water supply, preventing back feed of aerated hot water. The installation of a surrey flange ensures a "splutter – free" showering experience.
